Abstract:

The complete mitochondrial genome was sequenced in two individuals of Sakhalin taimen *Parahucho perryi*. The genome sizes were 16,652 bp and 16,653 bp in the two isolates. Gene arrangement, base composition, and size of the two sequenced haplotypes are very similar to the *P. perryi* genome previously published (KC897653), but do not contain two frame-disrupting indels in the ND4 gene.
